

## FRONT COVER DESCRIPTIONS

An example of a UK Seismological Bulletin page, in this case from the Kew Observatory, Surrey, England, showing the phase readings from the Galitzin seismograph for the magnitude 6.1 ML Dogger Bank earthquake of the 7th of June 1931 (the largest UK earthquake for which a magnitude can be calculated or reliably estimated).

This page also shows a monthly summary of instrument recording constants, essential for the calculation of earthquake parameters from the related seismogram.

Cutting from The Daily Mail describing some of the felt effects of the Dogger Bank earthquake.

*"Damage in Britain was reported from 71 different places, mostly along the E coast of England. The strongest effects were observed at Filey, Bridlington, Beverley and Hull. The top of a church spire was rotated at Filey. Although there were numbers of cases of chimneys and plaster being damaged, at no place were the effects sufficiently severe to be assessed unequivocally as 7 EMS. Slight damage was caused as far afield as Sudbury, Suffolk, Barnsley, Yorks. and Wooler, Northumberland. The complete collapse of a factory roof at Staines (Surrey) was attributed to the earthquake, though there is some doubt on this issue."*

*There were some geotechnical observations: rocks fell from the cliffs at Flamborough Head and there were falls of cliff at Mundesley, Norfolk. There were also some curious reports of lights seen in the sky at the time of the shock. The shock was reported as being felt on board ship by a number of vessels in the N Sea.*

*One woman in Hull seems to have died of a heart attack as a result of the earthquake."*

(from Musson, R.M.W., 1994. "A Catalogue of British Earthquakes", BGS Technical Report No WL/94/04.)

Galitzin Vertical component seismogram from Kew Observatory, annotated at the time of the recording to show the P and S arrivals. Note that this record reads from right to left.

Sketch map of the epicentral location and the limits of the felt area (intensity 2-3 EMS) for the Dogger Bank earthquake.

## **Abstract**

The National Seismological Archive (NSA) is a Customer Group-supported facility maintained by the British Geological Survey (BGS) in Edinburgh. Part of its remit is to maintain and make available for research its holdings of historical seismological material. Cataloguing of its holdings of over 14,500 worldwide and UK seismological bulletins has been completed, as part of a project to complete a full NSA database. An electronic version of these data have been placed as a searchable and updateable database on the GSGG web pages at <http://www.gsrg.nmh.sc.uk/~phoh/nsahome.htm>

## **1 Introduction**

### **1.1 The National Seismological Archive**

The National Seismological Archive (NSA) is maintained by the British Geological Survey (BGS) in Edinburgh. It is supported by a Customer Group of organisations under the chairmanship of the Department of the Environment, Transport and the Regions (DETR), (formerly the Department of the Environment (DoE)), with major financial input from the Natural Environment Research Council (NERC). The NSA is the United Kingdom national repository for seismologically related material. It contains a wide range of original seismograms, bulletins, reports, and reference material from all over the world dating from the late 1800s onwards, and held in a variety of media.

The key objectives of the NSA are:

- to curate and catalogue existing material. This includes microfilming, and the generation of electronically searchable data;
- to maintain a watching brief on archives held by other organisations, with a view to seeking the transfer to the NSA of any considered at risk;
- to supply data and provide inspection facilities for scientists and researchers.

### **1.2 The project**

Holdings of all seismological bulletins in the NSA were examined and details entered into the NSA database. The information was arranged alphabetically by country and made as complete as possible, with translations being provided, where necessary, for foreign language entries. In some cases these translations are approximate.

The searchable database version of the file has been placed on the GSGG Web Pages at <http://www.gsrg.nmh.sc.uk/~phoh/nsahome.htm> where users can search for items of interest. Periodic updates will be made to this digital file to take account of continuing acquisitions and further cataloguing.

## **2 Discussion**

The NSA database will ultimately contain details of all holdings in the NSA and be available as an online, constantly updated resource for researchers - one of the key objectives of the NSA. The collection of bulletins was identified as ideal for use as a 'test part' of what will become the full NSA database. The NSA cataloguing process

has been undertaken over a period of several years, resulting in a mixture of catalogue files (both paper and digital). Table 1 shows the constituent parts of the NSA database, with their assigned NSA identity codes.

Code	NSA Collection
<b>ABU</b>	Aberdeen University Collection
<b>ATJD</b>	ATJ Dollar Collection
<b>CSEM</b>	Centre Sismologique Euro-Méditerranéen Collection
<b>ET</b>	E Tillotson Collection
<b>JW</b>	J Wartnaby Collection

<b>UKEF</b>	UK Event Folder Collection
<b>UKSG</b>	UK Historical Seismogram Collection
<b>UKSR</b>	UK Seismicity Reference Collection
<b>WRP</b>	World Report and Publication Collection
<b>WSB</b>	World Seismological Bulletin Collection
<b>WWS</b>	WWSSN Microfilm Collection

**Table 1**

A master paper copy of the full bulletin catalogue data is provided for consultation in the NSA and as a record of work done. This file currently contains nearly 14,000 entries for world-wide seismological bulletins, and around 1000 entries for UK material. The locations of these bulletins are plotted on a map as a general guide to their geographical distribution (see Figure 1).

The earliest bulletin record is for the “*Observations made at the Magnetical and Meteorological Observatory at Batavia*” Vol. VI, Pt. 1, Published by the orders of the Government of Netherlands India, 1885, covering meteorological observations for 1881-1882 (plus a compilation of the results of observations between 1866-1882). This volume does not, in fact contain any seismological data, but has been catalogued as part of a series that begins to report ‘Seismometric Records’ in Vol. XXI, covering the period 1898-1899 (see Figures 2a & b). The combination of geophysical data from different disciplines in one observatory volume or series is common amongst the collection.

The above example (Figure 2b) of an early bulletin shows that basic earthquake readings were written down, showing phase arrival times and general comments (such as instrument notes or macroseismic details), but no calculations of magnitude or epicentre were attempted. Magnitude was not routinely noted in historical seismological bulletins until its invention in the 1930’s (Richter, 1935).

Later bulletins, such as the UK example from KEW Observatory (shown as Figure 3), normally provide instrumental recording parameters, and are therefore extremely important when attempting any calculations from historical seismograms. Often, the first page of any month will have a set of recording constants, and in the case of the KEW example this includes the date from which these constants apply.

### **3 Results**

Summary data are presented as Appendices 1 and 2 to this Report, reducing the full 14,653 records to an amount practical for publication. Appendix 1 provides a summary of holdings, arranged by country, place and then the start year of the overall span of bulletins held. Appendix 2 provides a chronological summary, sorted by the start year of bulletins held, then country, place and title. These appendices are designed to allow the researcher to get an overview of what bulletins are available and an idea of what the full NSA database will hold.

Map codes have been assigned, based on the country information, to provide useful look-up maps, which are given as Figures 1, 1a, 1b & 1c. Not all the map codes or bulletins held are plotted, only those where the assignment of a latitude and longitude was practical, i.e. single station bulletins are plotted, whereas networks are not. Bulletin page examples given as Figures 2a, 2b and 3. An electronic version of this report, which will be updated as necessary, is presented on the GSGG Web Pages at: <http://www.gsrg.nmh.ac.uk/~phoh/nsahome.htm>

The companion reports to this are “*UK Historical Seismological Observatories*” (Lovell and Henni, 1999) and “*UK Historical Seismograms held in the NSA*” (Henni, Lovell and Lawrie, 1999). These three reports provide the seismological researcher with a guide to UK seismological material extant in the UK. The ultimate project objective is to have a complete, detailed and searchable digital database of all NSA material.

### **4 Acknowledgements**

The continuing study of archival material is supported by a DETR-led Customer Group. This report is published with the permission of the Director of the British Geological Survey (NERC). Some of the figures were created using GMT (Wessel and Smith, 1995).

# Map of NSA held Bulletin Locations

This map only shows those bulletins for which a location is catalogued and does not include global or regional network or composite bulletins. It is, therefore, only a guide to what is held in the NSA. The codes used are those allocated for this report only and do not equate with international station codes.

# Map of NSA held Bulletin Locations

## Regional Map 1a

This map only shows those bulletins for which a location is catalogued and does not include global or regional network or composite bulletins. It is, therefore, only a guide to what is held in the NSA. The codes used are those allocated for this report only and do not equate with international station codes.

# Map of NSA held Bulletin Locations Regional Map 1b

This map only shows those bulletins for which a location is catalogued and does not include global or regional network or composite bulletins. It is, therefore, only a guide to what is held in the NSA. The codes used are those allocated for this report only and do not equate with international station codes.

# Map of NSA held Bulletin Locations

## Regional Map 1C

This map only shows those bulletins for which a location is catalogued and does not include global or regional network or composite bulletins. It is, therefore, only a guide to what is held in the NSA. The codes used are those allocated for this report only and do not equate with international station codes.

# Map of NSA held Bulletin Locations Regional Map 1d

This map only shows those bulletins for which a location is catalogued and does not include global or regional network or composite bulletins. It is, therefore, only a guide to what is held in the NSA. The codes used are those allocated for this report only and do not equate with international station codes.
